

About the project

The goal of the project, Curriculum Development in Agroecology (CDAE) is to provide access on agricultural knowledge and information on ecological and organic farming systems by developing a course for agroecology to the target groups. The CDAE project aims to define a new Master's course in Asian HEIs based on knowledge exchange between European and Asian HEIs.

The duration of the project is from November 2019-November 2022.

The specific objectives of the project includes:

- To educate professionals (farmers, agricultural specialists) with essential knowledge, transferable skills and experience via the developed MS program and increase their employability skills through the acquisition of specialized knowledge and the participation in internship program;
- To increase the capacity of the academic staff of Partner HEIs, improve the level of competences and skills through the development of a VET Program customized to their needs and needs of the 21st century and through the organisation of a replication training for the conceptualization of agroecology;
- To develop the professional capacity of the administrative staff of Partner HEIs through the provision of vocational training;
- To promote cooperation, exchange of know-how and good practices in the subject area between EU, PC HEIs, farmers, agricultural professionals, relevant policy makers and agricultural industries.

Agroecology ?

It is an approach for sustainable agricultural and food systems that designs, develops and promotes the transition towards biodiversity and low external input-based, socially sound farming and food systems and seeks to optimize the interactions between plants, animals, humans and the environment while taking into consideration the social aspects that need to be addressed for a sustainable and fair food system.

Agroecology will:

help in the sustainability of food production and agricultural systems; address the root cause of a problem; and provide local, practical, and eco-friendly solutions while taking into consideration the health of biodiversity.

Who will benefit?

Humans and the biodiversity will greatly benefit from this approach. Humans play an important role as they are the producers, consumers and agents for food security.
